Introduction

This report is intended to be a source document describing the SSI program and the people who receive benefits from the program. Tables and charts in the report cover a series of topics:

- Federal payment standards
- Recipient characteristics
- State-administered supplements
- Cross program payments
- Living arrangements
- Noncitizens
- Disability types
- Work incentives
- Resources
- Poverty
- Applications
- Awards
- Denials
- Suspensions

Changes for 2000:

For 2000, we have made a few additions to the report. First, we've added a new section on resources of SSI recipients. Recent policy discussions on changing the resource rules and limits have prompted these tables. Since the data come to us from an internal SSA annual survey, we hope to repeat them in future reports. We've also expanded our section on recipient characteristics to include several tables from the Survey of Income and Program Participation (SIPP) for December 1998. Although not quite as current as Social Security Administration (SSA) program data, this survey provides valuable information on recipient characteristics not available from SSA record sources, such as Medicaid recipiency and family incomes. To ensure that the survey respondents are SSI recipients, we have matched the SIPP data to SSA program records. Finally, we've begun a "poverty" section based on data from the SIPP survey. We will use the SIPP to report on how SSI reduces poverty among SSI families. We plan to expand this section in the future.

Four additional publications on the SSI program are also available on our Web site: State Assistance Programs for SSI Recipients; Children Receiving SSI; SSI Disabled Recipients Who Work; and SSI Recipients by State and County. For printed copies, please contact ORES.Publications@ssa.gov or telephone 202-358-6274.

SSI Program Highlights 2000

Size and Scope of Program

- In December 2000, about 6.6 million persons received federally administered payments. The average monthly payment was \$379.
- Total payments for the year were more than **\$30** billion.
- This amount includes about **\$3** billion in state supplementation, where the state has chosen to make such payments.

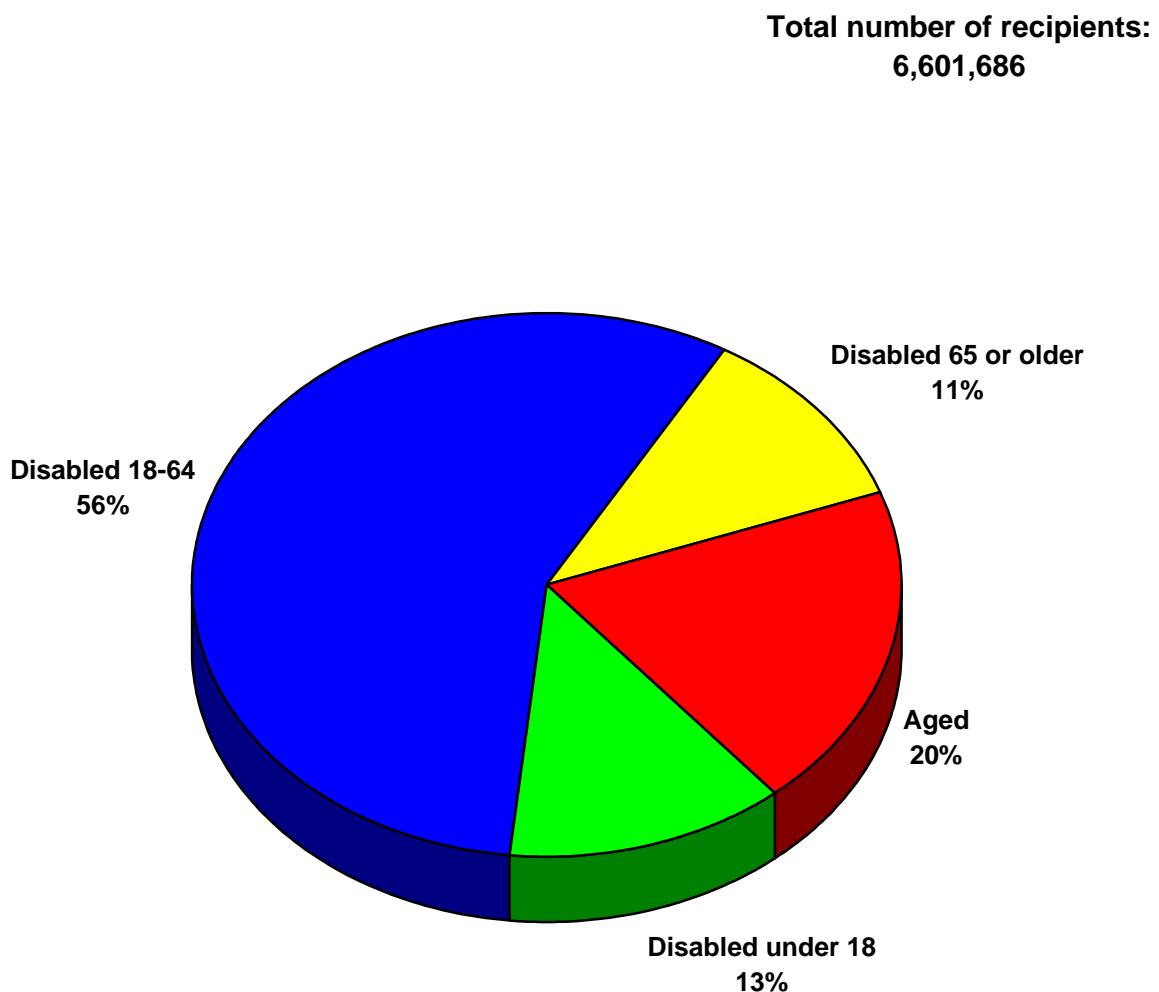

Recipient Profile

- Most SSI recipients are eligible based on a disability (80 percent).
- Almost six out of ten are mentally retarded or have another mental disorder.
- Most of them (55 percent) have no income other than their SSI payment.
- The most common income is Social Security benefits (36 percent).
- About 35 percent of recipients live alone, and about 7 percent are in institutions or other “care” situations.

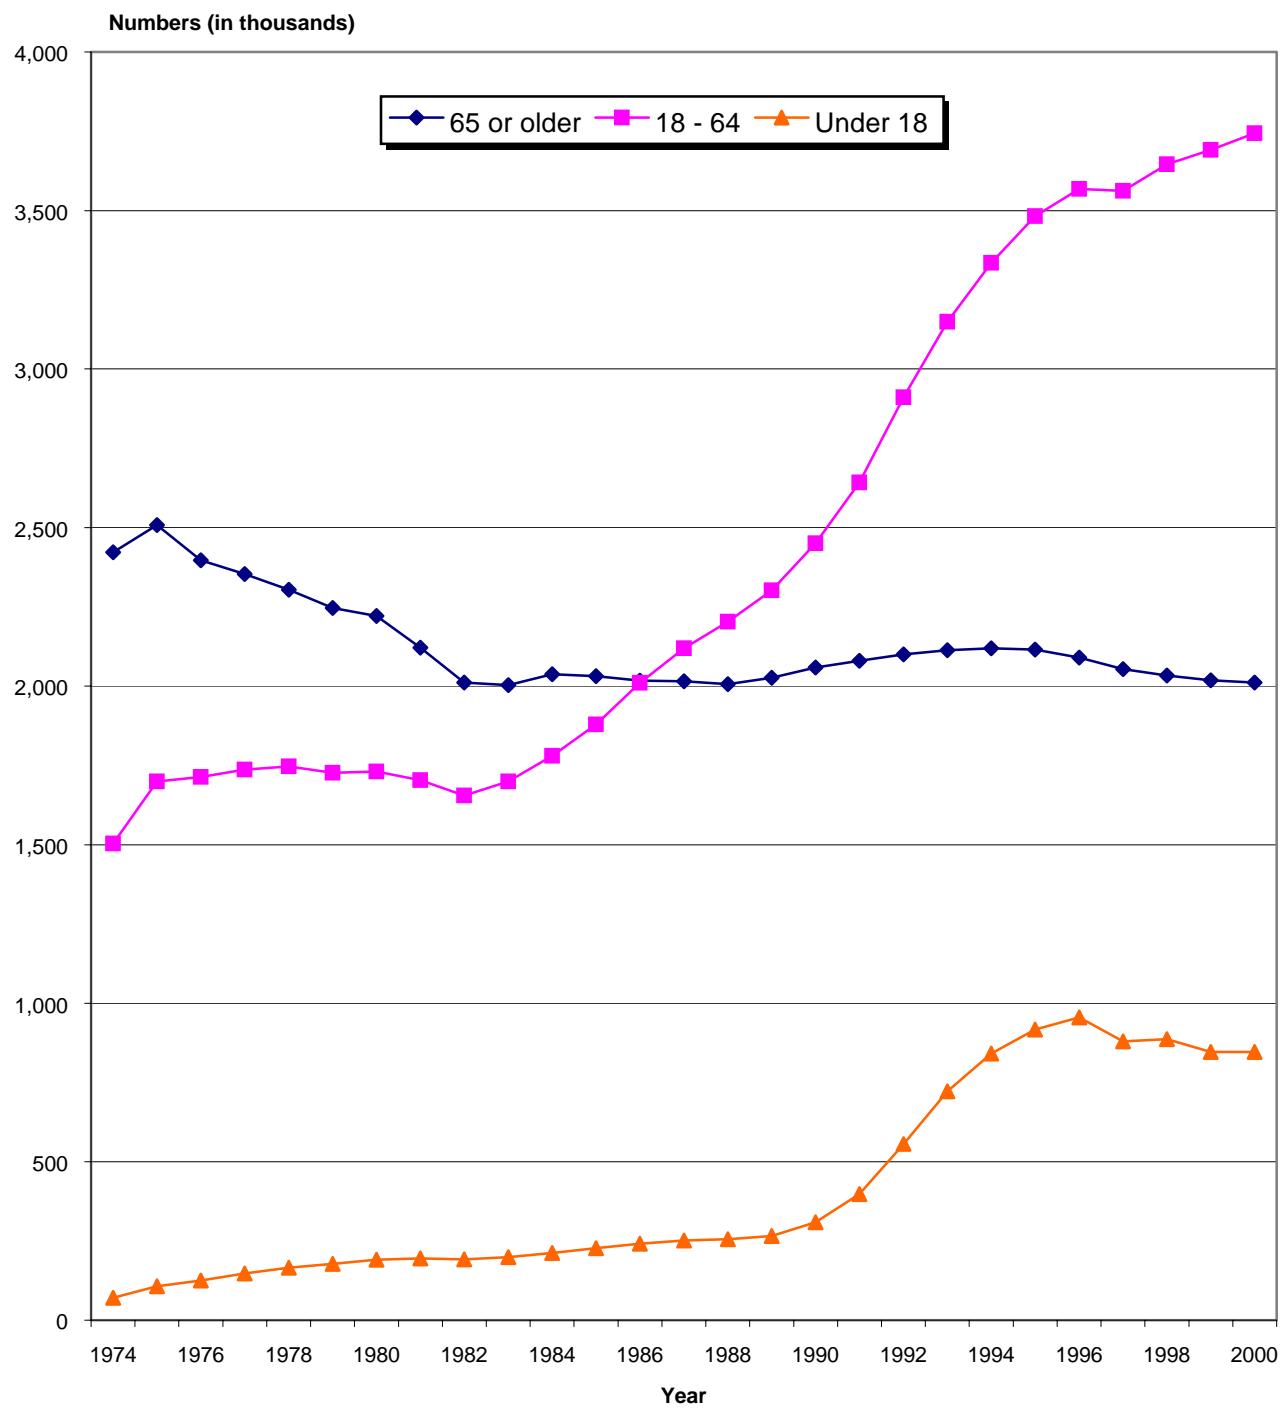

Encouraging Work

- Despite their disabilities, about 360,000 recipients (6 percent) were working at the end of the year.
- Among workers, one in three were able to take advantage of the work incentive provisions applicable to SSI.

1 Recipient counts shown from the SIPP are slightly higher than those published from administrative records. Although the survey of income and program participation records are matched to administrative data, lack of social security numbers on some SIPP records prevent a match and cause weighting problems.

¹Includes blind participants. For December 2000, of the 83,572 participants, 1,488 were blind.

²Data not available for December 1984, 1985, 1986.

Note: In January 1990, the Substantial Gainful Activity SGA level was raised from \$300 to \$500 and section 1619(a) participants with earnings below \$500 became eligible for regular SSI benefits rather than the special cash payments under section 1619(a). This is reflected in the decrease shown for 1990. In July 1999, the SGA level was further increased to \$700, resulting in the decrease shown for June 1999.

Sampling Variability

Estimates based on sample data may differ from the figures that would have been obtained had all, rather than a sample of records been used. These differences are termed sampling variability. The standard error is a measure of sampling variability; that is, the variation that occurs by chance because a sample is used. The standard error is used to describe confidence intervals. The confidence interval represents the extent to which the sample results can be relied upon to describe the results that would occur if the entire population (universe) had been used for data compilation rather than the sample.

In about 68 percent of all probability samples with the same selection criteria, the universe value would be included in the interval from one standard error below to one standard error above the sample estimate. Similarly, about 95 percent of all possible samples will give estimates within two standard errors, and about 99 percent will give estimates within two and one-half standard errors.

Tables I, II, and III provide approximation of standard errors of estimates shown in this report. Table I represents approximate standard errors for the estimated number of recipients from the 1-percent and 10-percent sample files. Table II represents approximation of standard errors for the estimated percentage of persons from the 1-percent file. Similar information about the 10-percent file is shown in Table III. Linear interpolation may be used to obtain values not specifically shown.
